

1. Problem Statement

The school IT helpdesk currently receives daily support requests (such as Wi-Fi issues, projector failures, and password problems) that staff manually review and assign. This manual process is time-consuming and leads to delayed response times.

2. Proposed Solution

Build an automated workflow using **ServiceNow Flow Designer** that analyzes key words in an incident's short description to automatically set the **Category**, **Subcategory**, and **Assignment Group**, and automatically send a confirmation email to the caller upon creation.

3. Business Requirements Checklist

Ensure your documentation includes these 6 core requirements from the portal:

1. **Automated Classification:** Automatically classify IT tickets based on the issue description.
2. **Category & Subcategory Assignment:** Set both fields dynamically without manual intervention.
3. **Dependent Choice Logic:** Ensure subcategories correctly align with their parent categories
4. **Automated Notification:** Send an email to the ticket caller immediately after ticket creation.
5. **Standardized Data:** Store ticket information in standard ServiceNow Incident schema fields.
6. **Scalability & Maintenance:** Design low-code Flow Designer logic so new rules can easily be added later.

Creation Of Custom Tables To Store Ticket Records:

The screenshot shows the ServiceNow 'Tables' configuration page for a table named 'Ticket Record'. The table is currently empty. The configuration includes a search bar, a filter bar, and a table with columns for Label, Name, Extends table, Extensible, and Updated. The 'Name' column is set to 'u_ticket_record' and the 'Updated' column shows the timestamp '2026-09-26 00:50:15'.

Label	Name	Extends table	Extensible	Updated
Ticket Record	u_ticket_record	(empty)	false	2026-09-26 00:50:15

Field Creation and Data Type Configuration

The screenshot shows the 'Form Design' interface for the 'Ticket Record' table. The left sidebar lists various field types, including Address (Simple), Currency, Data Structure, Dynamic Attribute Store, FX Currency, IP Address (Validated IPV4, IPV6), and Reference. The main area displays the table structure with columns for Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned to. Each column has a configuration icon (gear) and a delete icon (X).

Implementing Dependency Between Category and Subcategory Choice Fields

The screenshot shows the 'Ticket Record - Create TICKET0001008' form in ServiceNow. The 'Category' field is set to 'Network'. The 'Subcategory' dropdown menu is open, showing options: '-- None --' (highlighted in blue), 'Wi-Fi', and 'Wi-Fi'. The 'Short Description' field contains 'Wi-Fi'. Other fields include 'Number' (TICKET0001008), 'Caller', 'Description', 'State' (set to '-- None --'), 'Assigned Group', and 'Assigned to'. A 'Submit' button is visible at the bottom left.

Auto Classification using Flow design

Test Scenario 1

The screenshot shows the ServiceNow Workflow Studio interface. On the left, a workflow diagram is visible with steps like 'Update Incident' and 'Send Email'. The main area displays a 'Create Incident' form for incident INC0010001. The form includes fields for Number, Caller (Abel Tutor), Category (Hardware), Subcategory (Monitor), Service, Service offering, Configuration item, Short description (Monitor not working), and Description. On the right, there are dropdown menus for Channel (None), State (New), Impact (3 - Low), Urgency (3 - Low), and Priority (4 - Low). There are also fields for Assignment group and Assigned to. At the bottom, an 'ERROR HANDLER' section is visible with a toggle switch and a note: 'If an error occurs in your flow, the actions you add here will run.' The status is 'Published' and the application is 'Global'.

Test Scenario 2

The screenshot shows the ServiceNow Emails list view. The table displays a list of emails created on the day of the screenshot. The table has columns for Created, Recipients, Subject, Type, Notification type, and User ID. The first row shows an email created on 2026-09-26 02:59:49, sent to abel.tutor@example.com, with the subject 'Your request for issue has been submitted', type 'send-ready', notification type 'SMTP', and user ID '(empty)'.

Created	Recipients	Subject	Type	Notification type	User ID
2026-09-26 02:59:49	abel.tutor@example.com	Your request for issue has been submitted	send-ready	SMTP	(empty)

Make Update set to Complete State And Export File

ServiceNow interface showing the 'Update Set - Project Update Set' configuration page. The form includes fields for Name, State, Application, Created, Created by, Release date, Install date, Installed from, and Description. The State is set to 'Complete'. The Application is 'Global'. The Created date is '2026-09-26 00:25:46'. The Created by is 'admin'. The Description is 'Tracks configuration changes for Auto Ticket Classification using Flow Designer.' Below the form are buttons for 'Update' and 'Back Out'. There are also links for 'Export to XML', 'Merge With Another Update Set', and 'Scan Update Set'. At the bottom, there are tabs for 'Customer Updates (40)', 'Update Set Logs', 'Child Update Sets', and 'Install History'.

Conclusion

Objective Achieved: Successfully delivered an end-to-end automation solution for school IT helpdesks, eliminating manual ticket categorization and accelerating response times.

Core Functionality: Utilized ServiceNow Flow Designer to automatically classify incoming tickets based on short description keywords, paired with dependent choice fields for precise data capture and instant email notifications for callers.

Architecture & Security: Built using a no-code, phased configuration approach that ensures data integrity, strict access control, and low maintenance overhead.

Scalability: The modular design provides an immediate, reliable solution for academic environments while remaining fully extensible for future enhancements like assignment rules, SLA tracking, and predictive intelligence.
